

DATA GUARD SETUP

1. Masuk ke direktori file terlebih dahulu di primary dan standby
cd \$ORACLE_HOME/network/admin

2. Membuat file tnsnames.ora dan listener.ora di primary
vi tnsnames.ora

=== Script ===

```
ORCL_PRIMARY =  
(DESCRIPTION =  
  (ADDRESS = (PROTOCOL = TCP)(HOST = 192.168.56.10)(PORT = 1521))  
  (CONNECT_DATA =  
    (SERVER = DEDICATED)  
    (SERVICE_NAME = orcl)  
  )  
)
```

```
ORCL_STANDBY =  
(DESCRIPTION =  
  (ADDRESS = (PROTOCOL = TCP)(HOST = 192.168.56.20)(PORT = 1521))  
  (CONNECT_DATA =  
    (SERVER = DEDICATED)  
    (SERVICE_NAME = orcl_standby)  
  )  
)
```

vi listener.ora

=== Script ===

```
LISTENER =  
(DESCRIPTION_LIST =  
  (DESCRIPTION =  
    (ADDRESS = (PROTOCOL = TCP)(HOST = 192.168.56.10)(PORT = 1521))  
  )  
)
```

```
SID_LIST_LISTENER =  
(SID_LIST =  
  (SID_DESC =  
    (GLOBAL_DBNAME = orcl)  
    (ORACLE_HOME = /u01/app/oracle/product/19.0.0/dbhome_1)  
    (SID_NAME = orcl)  
  )  
)
```

3. Membuat file tnsnames.ora dan listener.ora di standby
vi tnsnames.ora

```
=== Script ===  
ORCL_PRIMARY =  
(DESCRIPTION =  
  (ADDRESS = (PROTOCOL = TCP)(HOST = 192.168.56.10)(PORT = 1521))  
  (CONNECT_DATA =  
    (SERVER = DEDICATED)  
    (SERVICE_NAME = orcl)  
  )  
)
```

```
ORCL_STANDBY =  
(DESCRIPTION =  
  (ADDRESS = (PROTOCOL = TCP)(HOST = 192.168.56.20)(PORT = 1521))  
  (CONNECT_DATA =  
    (SERVER = DEDICATED)  
    (SERVICE_NAME = orcl_standby)  
  )  
)
```

vi listener.ora

```
=== Script ===  
LISTENER =  
(DESCRIPTION_LIST =  
  (DESCRIPTION =
```

```
(ADDRESS = (PROTOCOL = TCP)(HOST = 192.168.56.20)(PORT = 1521))
)
)
```

```
SID_LIST_LISTENER =
(SID_LIST =
(SID_DESC =
(GLOBAL_DBNAME = orcl_standby)
(ORACLE_HOME = /u01/app/oracle/product/19.0.0/dbhome_1)
(SID_NAME = orcl)
)
)
```

4. Lalu Nyalakan Listener di Kedua Server

- lsnrctl start

5. Jika sudah sukses, Tes Panggil ke Primary (di standby)

- tnsping ORCL_PRIMARY

6. Kembali ke terminal Primary, tes panggil ke Standby

- tnsping ORCL_STANDBY

Pastikan keduanya menjawab dengan pesan OK.

7. Kita akan kirim file password dari Primary ke Standby menggunakan perintah scp (orapw)

Jalankan perintah ini di terminal exaprimary

```
scp /u01/app/oracle/product/19.0.0/dbhome_1/dbs/orapworcl
oracle@192.168.56.20:/u01/app/oracle/product/19.0.0/dbhome_1/dbs/
```

8. Masuk ke Tahap Konfigurasi Database (SQL)

-- Di primary --

sqlplus / as sysdba

startup

-- 1. Memberi identitas unik 'orcl'

ALTER SYSTEM SET DB_UNIQUE_NAME='orcl' SCOPE=SPFILE;

-- 2. Mengaktifkan fitur pengiriman log ke standby

```
ALTER SYSTEM SET LOG_ARCHIVE_CONFIG='DG_CONFIG=(orcl,orcl_standby)';
```

-- 3. Menentukan alamat pengiriman (ke alias ORCL_STANDBY)

```
ALTER SYSTEM SET LOG_ARCHIVE_DEST_2='SERVICE=ORCL_STANDBY NOAFFIRM ASYNC  
VALID_FOR=(ONLINE_LOGFILES,PRIMARY_ROLE) DB_UNIQUE_NAME=orcl_standby';
```

-- 4. Menentukan lokasi penerimaan jika suatu saat dia jadi standby

```
ALTER SYSTEM SET FAL_SERVER='ORCL_STANDBY';
```

-- Di standby --

sqlplus / as sysdba

startup

-- 1. Memberi identitas unik 'orcl_stby'

```
ALTER SYSTEM SET DB_UNIQUE_NAME='orcl_standby' SCOPE=SPFILE;
```

-- 2. Mengaktifkan fitur sinkronisasi

```
ALTER SYSTEM SET LOG_ARCHIVE_CONFIG='DG_CONFIG=(orcl,orcl_standby)';
```

-- 3. Menentukan alamat pengiriman balik (jika nanti switchover)

```
ALTER SYSTEM SET LOG_ARCHIVE_DEST_2='SERVICE=ORCL_PRIMARY NOAFFIRM ASYNC  
VALID_FOR=(ONLINE_LOGFILES,PRIMARY_ROLE) DB_UNIQUE_NAME=orcl';
```

-- 4. Menentukan sumber data utama

```
ALTER SYSTEM SET FAL_SERVER='ORCL_PRIMARY';
```

9. restart database di kedua server agar DB_UNIQUE_NAME yang tadi diatur di SPFILE bisa aktif

- shut immediate;

- startup;

10. kita tinggal menyamakan kondisi terakhirnya agar mereka bisa sinkron secara otomatis.

11. di standby Ubah Control File menjadi Standby

sqlplus / as sysdba

```
-- Matikan dulu untuk memastikan bersih  
shut immediate;
```

```
-- Start ke mode NOMOUNT  
startup nomount;
```

```
-- Pastikan DB_UNIQUE_NAME sudah benar (harusnya orcl_stby)  
SHOW PARAMETER DB_UNIQUE_NAME;
```

12. Buat Standby Control File di Primary

```
sqlplus / as sysdba
```

```
- ALTER DATABASE CREATE STANDBY CONTROLFILE AS '/tmp/standby_control.ctl';
```

13. Lalu kirim file tersebut ke server standby

```
- scp /tmp/standby_control.ctl oracle@192.168.56.20:/tmp/
```

14. Pindah ke terminal exastandby (192.168.56.20), Kita akan menimpa file lama dengan file "standby.ctl" yang baru kita terima.

```
- sqlplus / as sysdba
```

```
- SHUT IMMEDIATE;
```

```
# Hapus file lama agar tidak ada konflik
```

```
- rm /u01/app/oracle/oradata/ORCL/controlfile/o1_mf_o1g82g46_.ctl
```

```
- rm /u01/app/oracle/fast_recovery_area/ORCL/controlfile/o1_mf_o1g82g8r_.ctl
```

catatan: Sesuaikan nama filenya dengan nama file kalian sendiri

```
# Lalu timpa file nya
```

```
- cp /tmp/standby_control.ctl /u01/app/oracle/oradata/ORCL/controlfile/o1_mf_o1g82g46_.ctl
```

```
- cp /tmp/standby_control.ctl
```

```
/u01/app/oracle/fast_recovery_area/ORCL/controlfile/o1_mf_o1g82g8r_.ctl
```

16. Setelah filenya diganti, masuk ke SQLPlus untuk menyalakan database dalam mode standby.

```
- sqlplus / as sysdba
```

```
-- Matikan dulu jika tadi masih menyala
```

```
SHUT IMMEDIATE;
```

-- Start ke mode MOUNT

```
STARTUP MOUNT;
```

-- Verifikasi peran database

```
SELECT DATABASE_ROLE FROM V$DATABASE;
```

-- Jalankan query ini untuk pembuktian

```
SELECT NAME, DATABASE_ROLE, CONTROLFILE_TYPE FROM V$DATABASE;
```

hasilnya harus:

DATABASE_ROLE: PHYSICAL STANDBY

CONTROLFILE_TYPE: STANDBY

-- jalankan perintah ini untuk membiarkan Oracle mencari log yang dibutuhkan secara otomatis

```
ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT FROM SESSION;
```

-- Cek Status Proses (Monitoring)

```
SELECT PROCESS, STATUS, SEQUENCE# FROM V$MANAGED_STANDBY;
```

-- Jalankan MRP (Managed Recovery Process)

-- Perintah ini akan menyalakan "mesin" pengolah data di standby

```
ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT USING CURRENT  
LOGFILE;
```

-- Cek Statusnya

```
SELECT PROCESS, STATUS, SEQUENCE# FROM V$MANAGED_STANDBY;
```

-- Jika MRPO masih blum terlihat cek log error di standby

17. Cek Pesan Error di Alert Log

```
- tail -n 100 /u01/app/oracle/diag/rdbms/orcl/orcl/trace/alert_orcl.log
```

Di server standby, LOG_ARCHIVE_DEST_2 seharusnya diarahkan ke dirinya sendiri atau dikosongkan terlebih dahulu agar tidak mencoba mengirim log balik ke primary saat dia belum sinkron.

```
- sqlplus / as sysdba
```

```
- STARTUP MOUNT;
```

18. Tambahkan Standby Redo Log (SRL)

```
ALTER DATABASE ADD STANDBY LOGFILE GROUP 11  
('/u01/app/oracle/oradata/ORCL/standby_redo11.log') SIZE 200M;  
ALTER DATABASE ADD STANDBY LOGFILE GROUP 12  
('/u01/app/oracle/oradata/ORCL/standby_redo12.log') SIZE 200M;  
ALTER DATABASE ADD STANDBY LOGFILE GROUP 13  
('/u01/app/oracle/oradata/ORCL/standby_redo13.log') SIZE 200M;  
ALTER DATABASE ADD STANDBY LOGFILE GROUP 14  
('/u01/app/oracle/oradata/ORCL/standby_redo14.log') SIZE 200M;
```

19. masuk ke rman untuk sinkronisasi

- rman target sys/123@ORCL_PRIMARY

20. Setelah masuk ke prompt RMAN, Reset Incarnation secara Manual untuk menata ulang strukturnya

- reset database to incarnation 2;

21. Hentikan Semua Proses Recovery (di SQLPlus)

sqlplus / as sysdba

-- Hentikan proses managed recovery jika ada yang nyangkut

```
ALTER DATABASE RECOVER MANAGED STANDBY DATABASE CANCEL;
```

-- Jika masih error, matikan database untuk melepaskan semua kunci (locks)

```
SHUT ABORT;
```

22. Di terminal Linux exastandby, pastikan tidak ada proses Oracle yang masih menggantung

- ps -ef | grep ora_ | grep ORCL

23. Hapus File Fisik yang Bermasalah

- rm /u01/app/oracle/oradata/ORCL/datafile/o1_mf_system_o1g7y09k_.dbf

24. Kill Semua Sesi & Proses

Matikan paksa instance

sqlplus / as sysdba <<EOF

```
SHUT ABORT;
```

```
EOF
```

```
# Pastikan tidak ada proses background 'ora_' yang tersisa  
ps -ef | grep ora_ | grep ORCL | awk '{print $2}' | xargs kill -9 2>/dev/null
```

Hapus File Fisik (Eksekusi Mati)

```
rm -f /u01/app/oracle/oradata/ORCL/datafile/o1_mf_system_nzn824kh_.dbf
```

25. Jalankan Kembali ke Mode NOMOUNT

```
- sqlplus / as sysdba  
- STARTUP NOMOUNT;  
- exit;
```

26. Masuk ke rman

```
- rman target sys/123@ORCL_PRIMARY auxiliary sys/123@ORCL_STANDBY
```

27. Jalankan Duplicate dari RMAN ((DUPLICATE) adalah solusi jika cara manual di poin 16 gagal karena masalah sinkronisasi file sistem).

```
- DUPLICATE TARGET DATABASE FOR STANDBY FROM ACTIVE DATABASE NOFILENAMECHECK;
```

node: RMAN sudah melakukan semuanya dengan benar: menarik standby controlfile, melakukan restore semua datafile via jaringan, dan melakukan switch ke file-file yang baru. Masalah "hantu" lock dan orphan incarnation tadi sudah terkubur bersama file-file lama yang ditimpa oleh RMAN.

Sekarang database kamu sudah dalam kondisi MOUNT dengan struktur yang benar-benar identik dengan Primary.

28. Buka Database (Active Data Guard)

```
- sqlplus / as sysdba  
- ALTER DATABASE OPEN READ ONLY;
```

Catatan : Menjalankan OPEN READ ONLY sebelum RECOVER MANAGED adalah kunci agar database menjadi Active Data Guard.

29. Tambahkan Standby Redo Log (SRL)

```
ALTER DATABASE ADD STANDBY LOGFILE GROUP 11  
('/u01/app/oracle/oradata/ORCL_STANDBY/datafile/srl_11.log') SIZE 200M;  
ALTER DATABASE ADD STANDBY LOGFILE GROUP 12  
('/u01/app/oracle/oradata/ORCL_STANDBY/datafile/srl_12.log') SIZE 200M;
```

```
ALTER DATABASE ADD STANDBY LOGFILE GROUP 13  
('/u01/app/oracle/oradata/ORCL_STANDBY/datafile/srl_13.log') SIZE 200M;  
ALTER DATABASE ADD STANDBY LOGFILE GROUP 14  
('/u01/app/oracle/oradata/ORCL_STANDBY/datafile/srl_14.log') SIZE 200M;
```

30. Nyalakan Managed Recovery (MRP)

- ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT USING CURRENT LOGFILE;

31. Cara Verifikasi untuk memastikan "mesin" sudah menyala

- SELECT PROCESS, STATUS, SEQUENCE# FROM V\$MANAGED_STANDBY WHERE PROCESS LIKE 'MRP%';

32. Tes Pengiriman Log (DI PRIMARY)

-- Di SQL exaprimary

ALTER SYSTEM SWITCH LOGFILE;

33. Cek Perubahan (DI STANDBY)

-- Di SQL exastandby

SELECT PROCESS, STATUS, SEQUENCE# FROM V\$MANAGED_STANDBY WHERE PROCESS LIKE 'MRP%';

(Angka SEQUENCE# Jika naik, berarti sinkronisasi log sudah berjalan otomatis.)

(Dokumentasi Mengecek sinkronisasi perubahan yang terjadi di primary terjadi juga di standby:

-- di Primary --

CREATE TABLE tes_sinkron (id NUMBER, waktu DATE, pesan VARCHAR2(50));

INSERT INTO tes_sinkron VALUES (1, SYSDATE, 'Berhasil Sinkron Gan!');

COMMIT;

ALTER SYSTEM SWITCH LOGFILE;

-- di standby

SELECT * FROM tes_sinkron;

Hasil: Jika hasilnya keluar di standby, maka sinkronisasi sudah berhasil.

34. Monitoring (suatu saat kamu ingin mengecek apakah ada "selisih" (gap) antara Primary dan Standby, gunakan query ini di Standby)

```
- SELECT ARCHIVED_THREAD#, ARCHIVED_SEQ#, APPLIED_THREAD#, APPLIED_SEQ#  
FROM V$ARCHIVE_DEST_STATUS;  
SELECT name, value FROM v$dataguard_stats WHERE name LIKE 'apply lag';
```

35. Paksa Sinkronisasi (DI PRIMARY)

```
- ALTER SYSTEM ARCHIVE LOG CURRENT;
```

36. Cek Status Final (DI STANDBY)

```
- SELECT ARCHIVED_THREAD#, ARCHIVED_SEQ#, APPLIED_THREAD#, APPLIED_SEQ#  
FROM V$ARCHIVE_DEST_STATUS  
WHERE ARCHIVED_SEQ# > 0;
```

37. Langkah Penutupan untuk pengecekan "identitas" terakhir di exastandby

```
- SELECT DATABASE_ROLE, OPEN_MODE, PROTECTION_MODE, PROTECTION_LEVEL  
FROM V$DATABASE;
```

Hasil yang seharusnya muncul:

DATABASE_ROLE: PHYSICAL STANDBY

OPEN_MODE: READ ONLY WITH APPLY (Artinya ini Active Data Guard, kamu bisa query sambil sinkronisasi jalan).

PROTECTION_LEVEL: MAXIMUM PERFORMANCE (Default standar).

PROTECTION_LEVEL: MAXIMUM PERFORMANCE

38. Apa yang harus dilakukan jika Sequence tidak naik-naik?

Jika setelah 5 menit APPLIED_SEQ# untuk sequence 12 masih tetap 0, cukup jalankan ini di exastandby

```
- ALTER DATABASE RECOVER MANAGED STANDBY DATABASE CANCEL;
```

```
- ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT USING CURRENT  
LOGFILE;
```
